Screws

Types of Screw

Woodscrews are tapered, with large threads and a smooth shank for pulling two pieces of material together. They can be used in wood and other soft materials when stronger joining than a nail is needed.

Self-tapping screws are designed to drill their own hole as they are screwed into wood, plastic or metal. They are ideal for items that require regular maintenance and work well when working with two different kinds of material being fastened together.

Machine screws are used for joining metal parts and are fully threaded for use with a nut or in a tapped hole. Usually driven with a screwdriver rather than a spanner.

Coach screws are large screws with hexagonal heads. Typically used for wood construction and holding timber to masonry, they are for heavy holding and are driven in with a spanner or socket rather than a screwdriver.

Hexagon bolts, or hexagon head 'Set' screws are used in machinery and construction and can be used with a nut or in a tapped hole. 'Set' Screws are fully threaded whilst 'Set' Bolts are part threaded.

Cup Square or Carriage bolts have smooth, domed heads with a square section underneath the cup which stops rotation of the bolt when tightening. They are mainly for fastening timber to timber and are extensively used for timber joist construction and in decking applications.

Screw Head Types

Flat Countersunk	Round Head	Pan Head	Raised Head	Hexagon Head
Flat countersunk screw-heads sit entirely flush with a surface when fitted, leaving none of the head exposed.

Countersinking provides a neater finish and can be combined with screw caps to hide screws. Commonly used in soft and hard woodworking applications. | Unlike a countersunk screw, a round (or domed) head screw sits above the work surface and is used when a more decorative finish is required. | Pan head screws are mainly used for metal-work as their larger diameter provides a greater strength to hold the material more firmly. | A raised head is a cross between a countersunk and a round head. It has a round top but tapers towards the shank.

Commonly used when a more decorative finish is required. | The hexagon (or 'Hex') drive allows the use of sockets and spanners to tighten and loosen the screw (or bolt).

The larger contact surface area allows large amounts of force to be applied. |

Woodscrews - Countersunk - Steel Hardened Twin Thread

Heavy Duty Nylon Wall Plugs

- Stronger and more durable than plastic.
- Protruding side fins stop plug from twisting once inserted.
- Rimmed top rests on the surface of the base material so the plug is not lost in the hole- especially useful when the depth of the base material is not known.

Plasterboard Spring Toggle

Spring toggles offer the best support for hanging on a plasterboard wall. The metal toggle is squeezed flat and pushed through a pre-drilled hole in the plasterboard. The toggle then springs open and pulls flat against the inside face. As the screw is tightened, the wings are pulled tight against the inside face and spread the weight of the load.

Polybag with Colour Label

Code	Size (mm)	Contents	Outer
002969N	3/16" / M5 x 50mm	3	10

Plasterboard Plastic Toggle

These plastic fixings are squeezed flat and slotted into a pre-drilled hole. Once inside, the flattened end opens out to act as the anchor. The screw then pulls the two flaps flat against the inner face of the plasterboard to fix it in place.

Polybag with Colour Label

Code	Type	Contents	Outer
005144N	Toggle Plug c/w Screws	4+4	10

Plasterboard Driva - Plastic Plug

Combine a metal or plastic plug with a screw-thread for the fixing screw. The deep outer thread is designed to give a much better grip on the plasterboard, whilst also spreading the weight of the object they are holding up.

Hollow Cavity Wall Anchors

Have a toothed flange to grip the outer surface of the plasterboard. They are pushed into a pre-drilled hole and as the screw is tightened four 'wings' spread outwards to grip against the inside face of the plasterboard.

Nails & Pins

There are many type of nail available and selection can be often be confusing as names and terminology will sometimes vary. Here is a brief guide to the range of nails available from Select Hardware:

Types of Nail

ROUND WIRE NAILS have a large round head and are generally used for carpentry where strength is vital but appearance is not. They can also split wood when hammered in. Select supplies both Bright and Galvanised finishes.

OVAL NAILS can easily be punched below the surface making them suitable for joinery work and jobs where appearance is important. They are also less likely to split the wood when hammered in with longer sides parallel to the wood grain.

LOST HEAD NAILS are stronger than oval nails and can also be punched below the wood surface.

MASONRY NAILS are made of hardened steel and used for connecting wood to masonry, brick, concrete and breeze blocks.

ANNULAR RING NAILS are used for creating very strong joints in plywood and other materials. They have a serated edge which holds the material more firmly in place than a smooth nail and therefore have a strong pull-out resistance.

CLOUT NAILS are made from galvanised steel and have a large flat retaining head ideal for fixing soft materials such as roofing felt and plasterboard.

STAPLES are made from galvanised steel and are ideal for outdoor use securing fencing, wire and netting.

MOULDING PINS are small fine nails for use in fine woodworking, beading, craft and delicate applications. They have a thin body to avoid wood splitting and can be used is delicate applications.

PANEL PINS are lightweight nails used in cabinet making and fixing small mouldings. Also used in craft and delicate applications.
